

Skin Histology Lecture/Lab

Thick, Cornified Skin

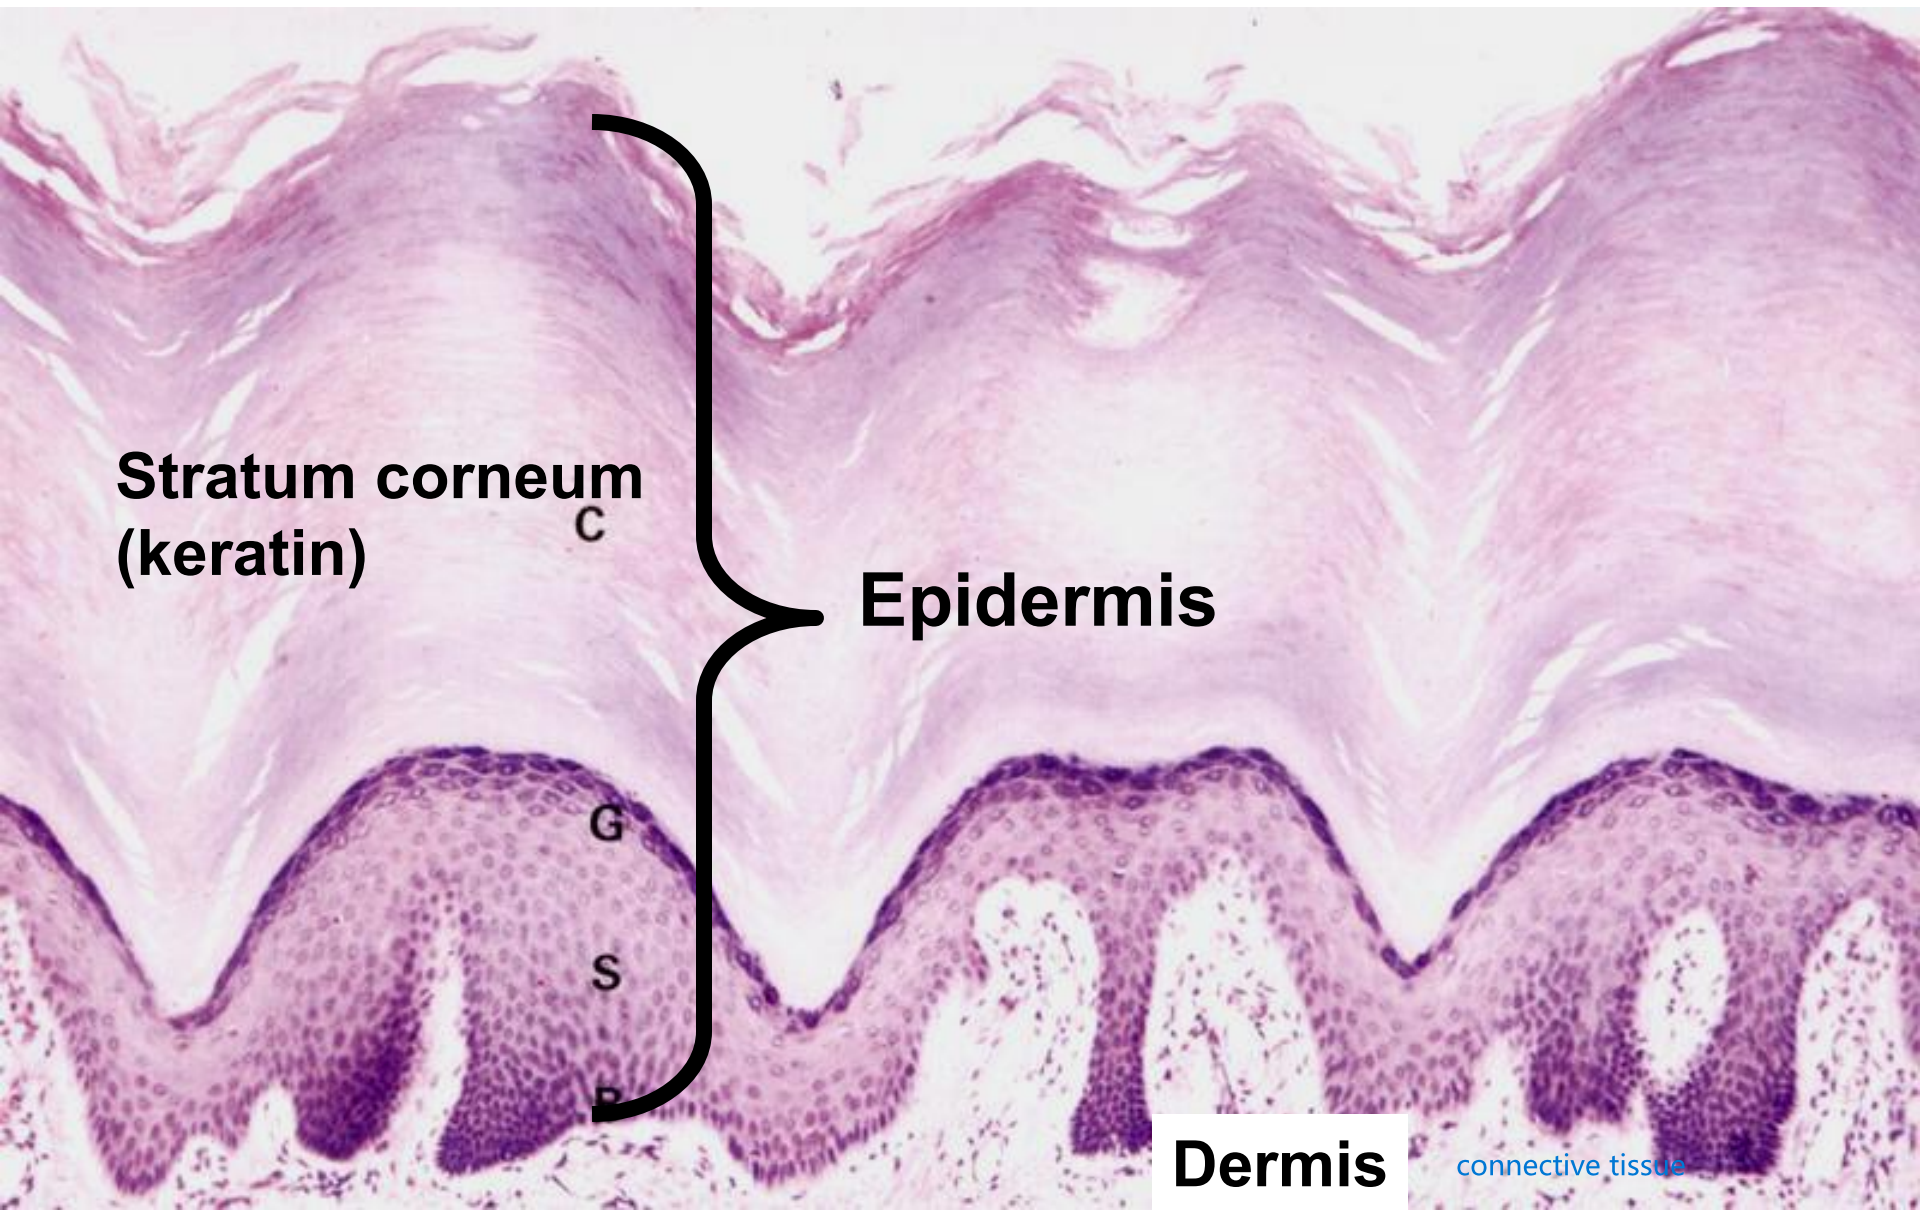

palms of hand and soles of feet - no hair, thicker keratin

Thin skin (scalp)

everywhere else

Epidermis - Thick Skin

Wheater 9.2

**Stratum corneum
(keratin)**

C

Epidermis

G

S

P

Dermis

connective tissue

Apical

fate to become keratin and die

Stratum corneum

everything above,
keratin based layer

nuclei condense - discontinuous layer

Stratum lucidum

filled with keratohyalin
granules

Stratum granulosum

Stratum spinosum

adhere to one another with adherens juncti
spinosum spines within white area

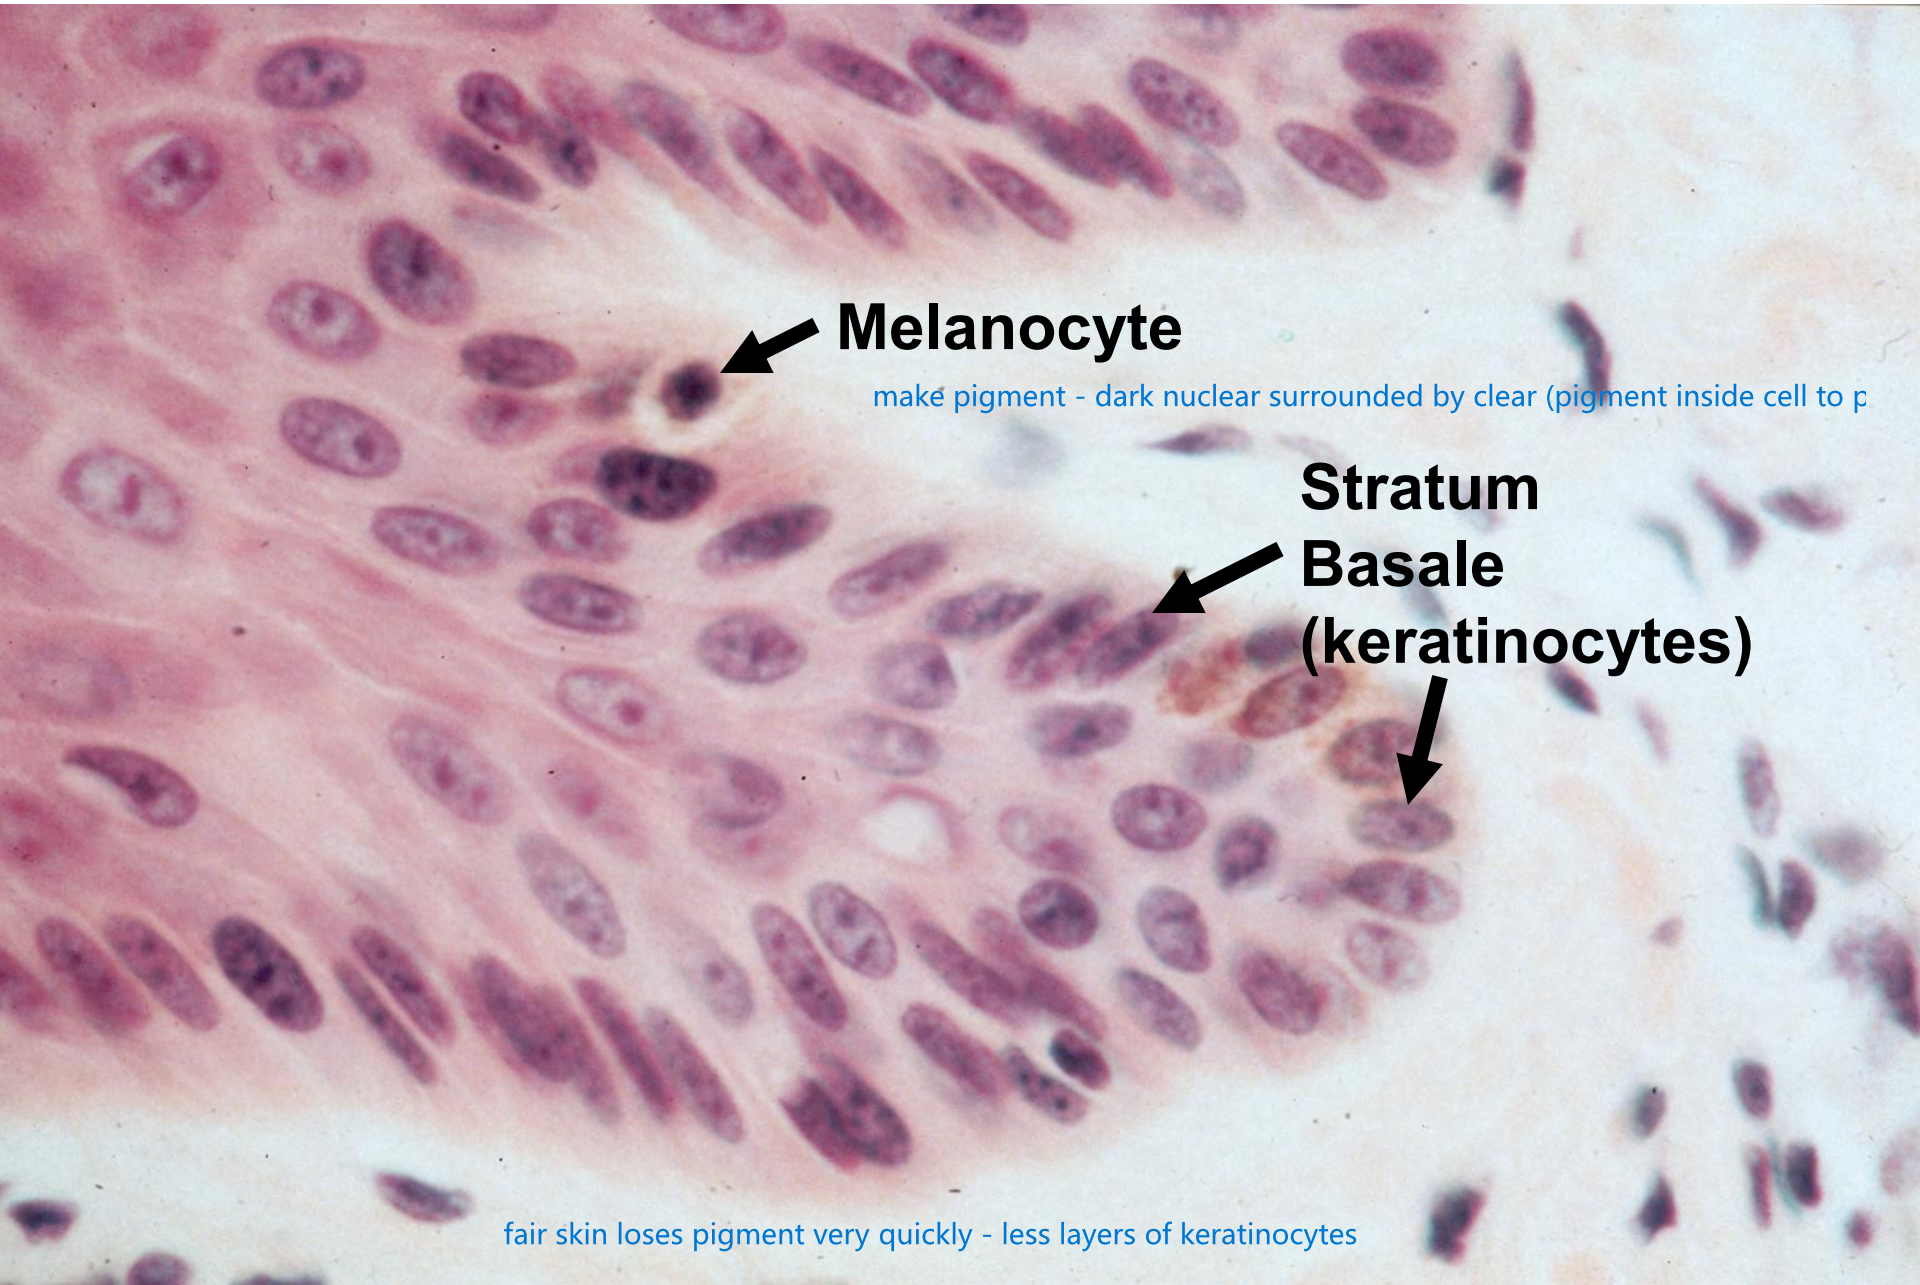

Stratum germinativum

start at basal
layer

aka stratum basale - where keratinocytes are born

Epidermis – Thick Skin

Melanocyte Among Basal Keratinocytes

Melanocyte

make pigment - dark nuclear surrounded by clear (pigment inside cell to p

**Stratum
Basale
(keratinocytes)**

fair skin loses pigment very quickly - less layers of keratinocytes

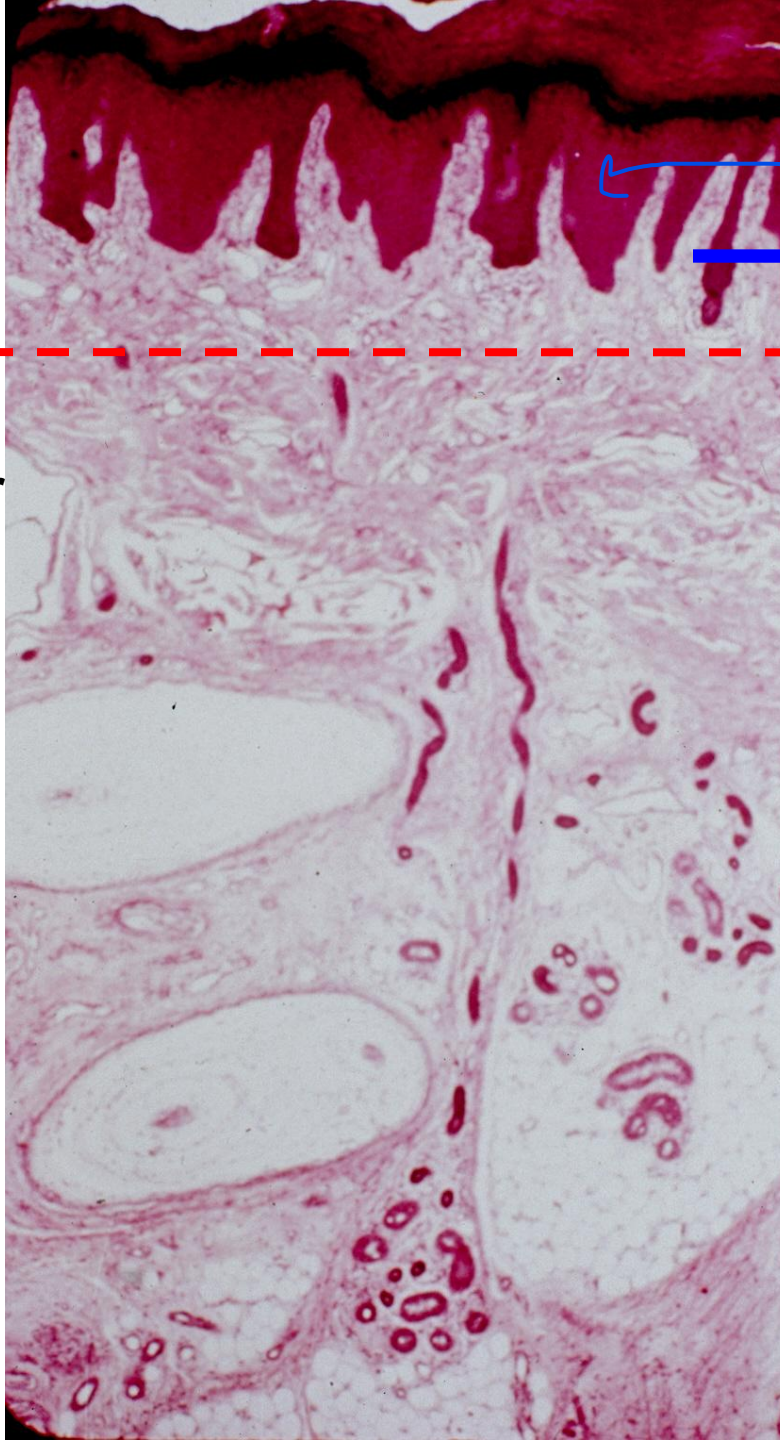

Thick Skin-Dermis

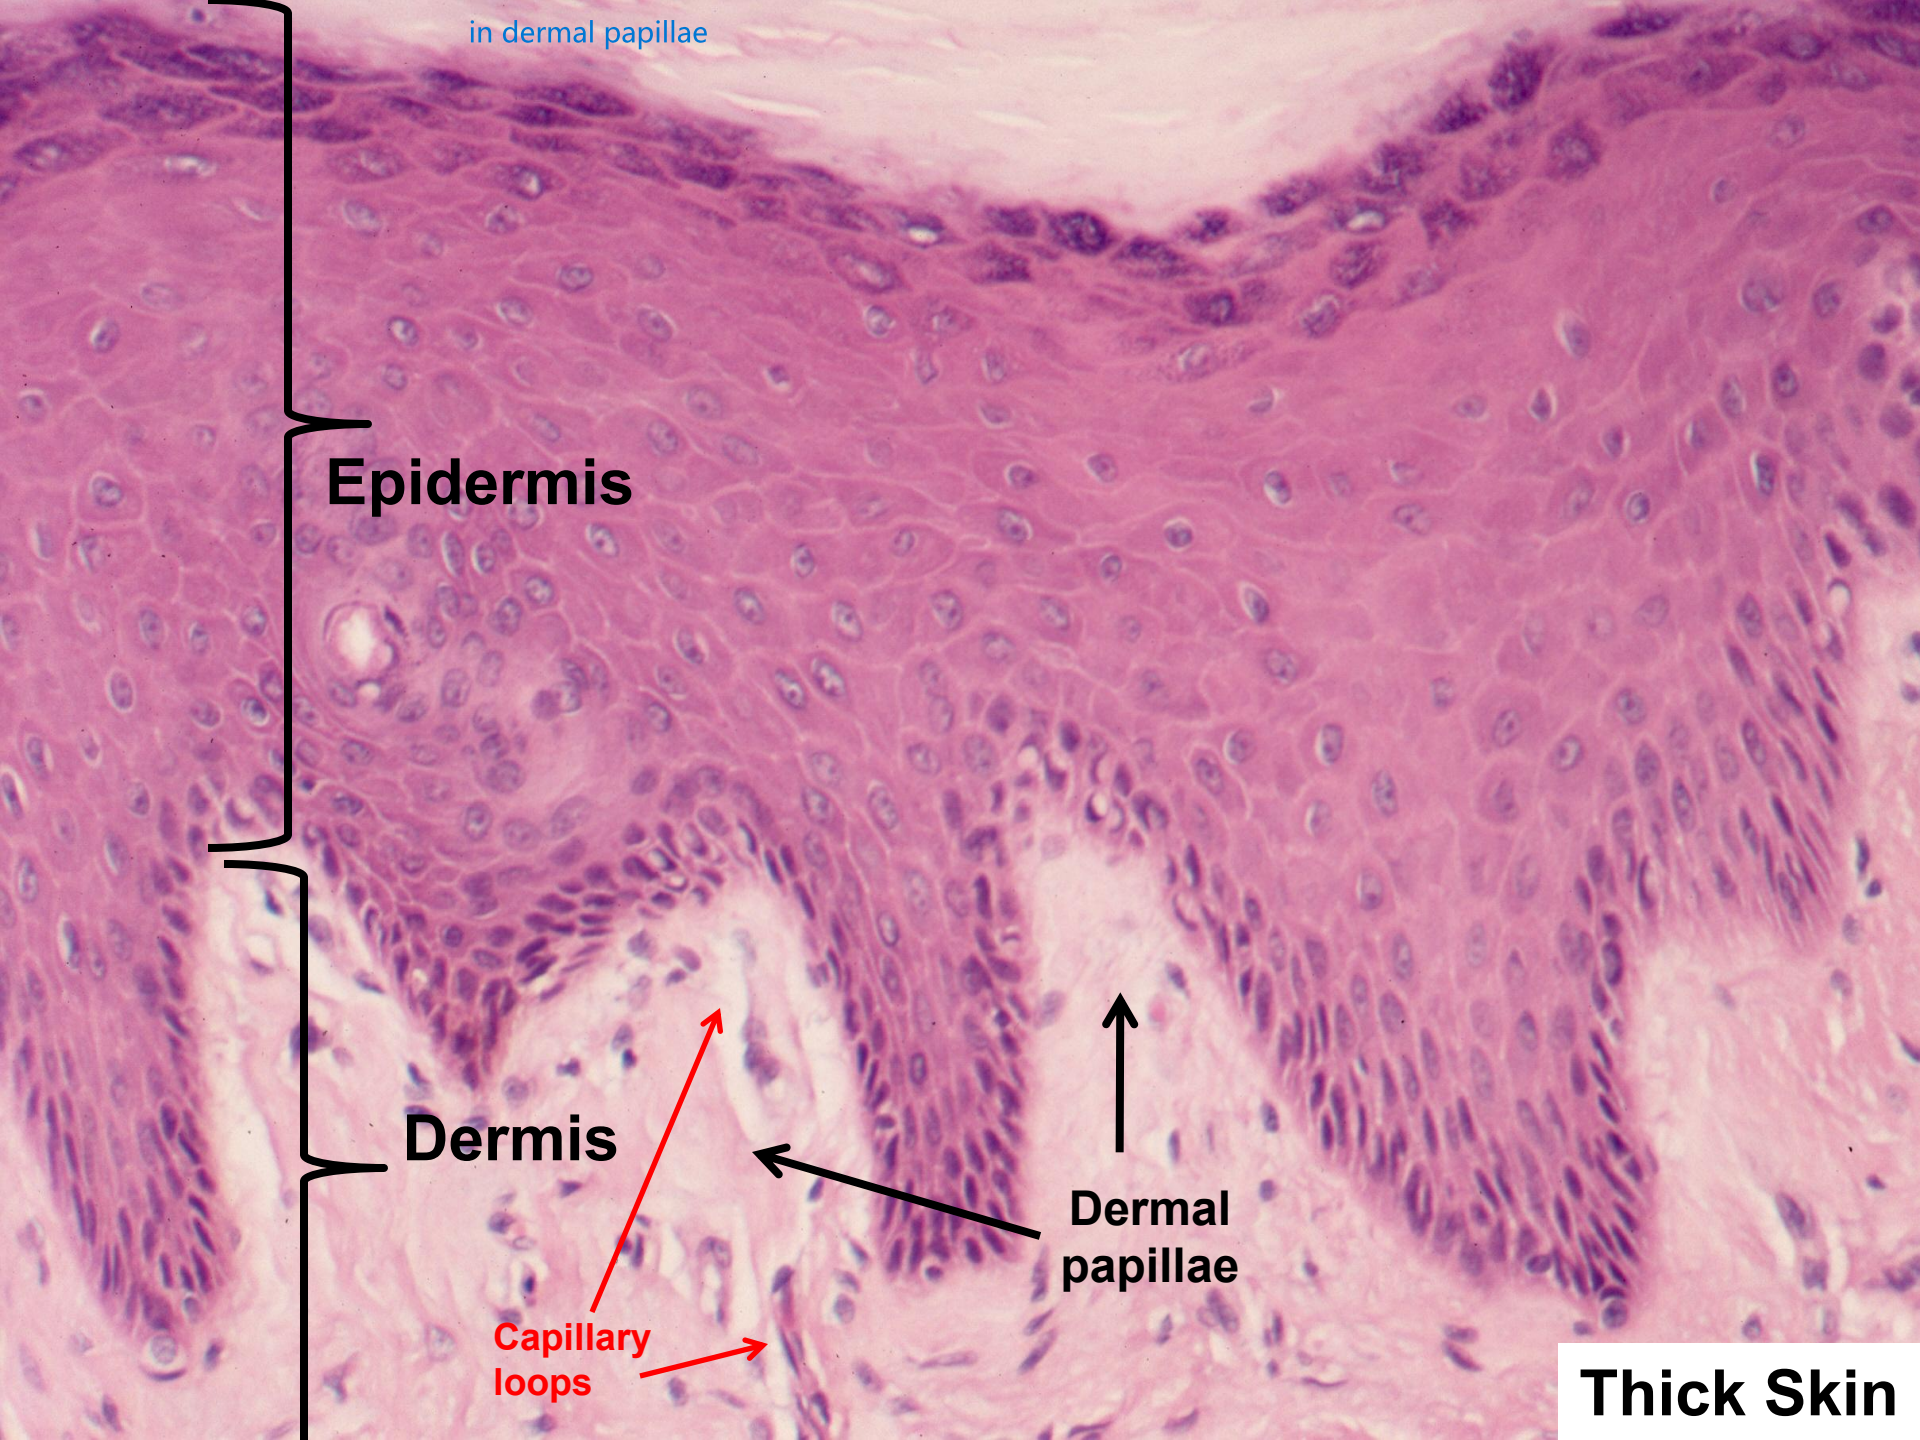

closer to epidermis

Papillary layer

dermal papule

Reticular layer

in dermal papillae

Epidermis

Dermis

**Capillary
loops**

**Dermal
papillae**

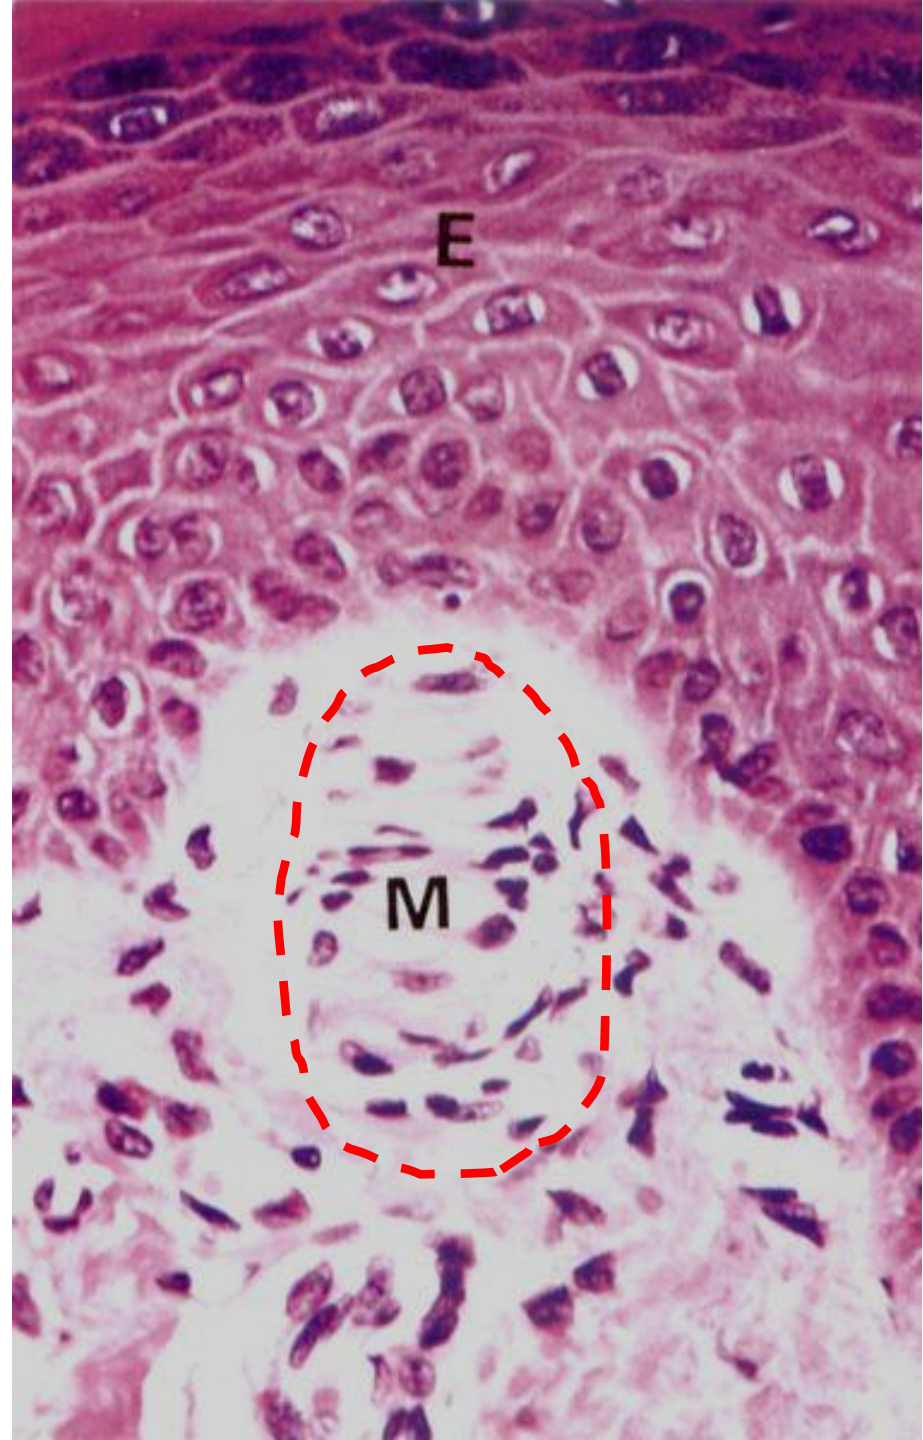

Thick Skin

Meissner's Corpuscle Wheater

**Sensory touch
nerve receptors
found in dermal
papillae.
Look like mummies.**

supportive cells that wrap around

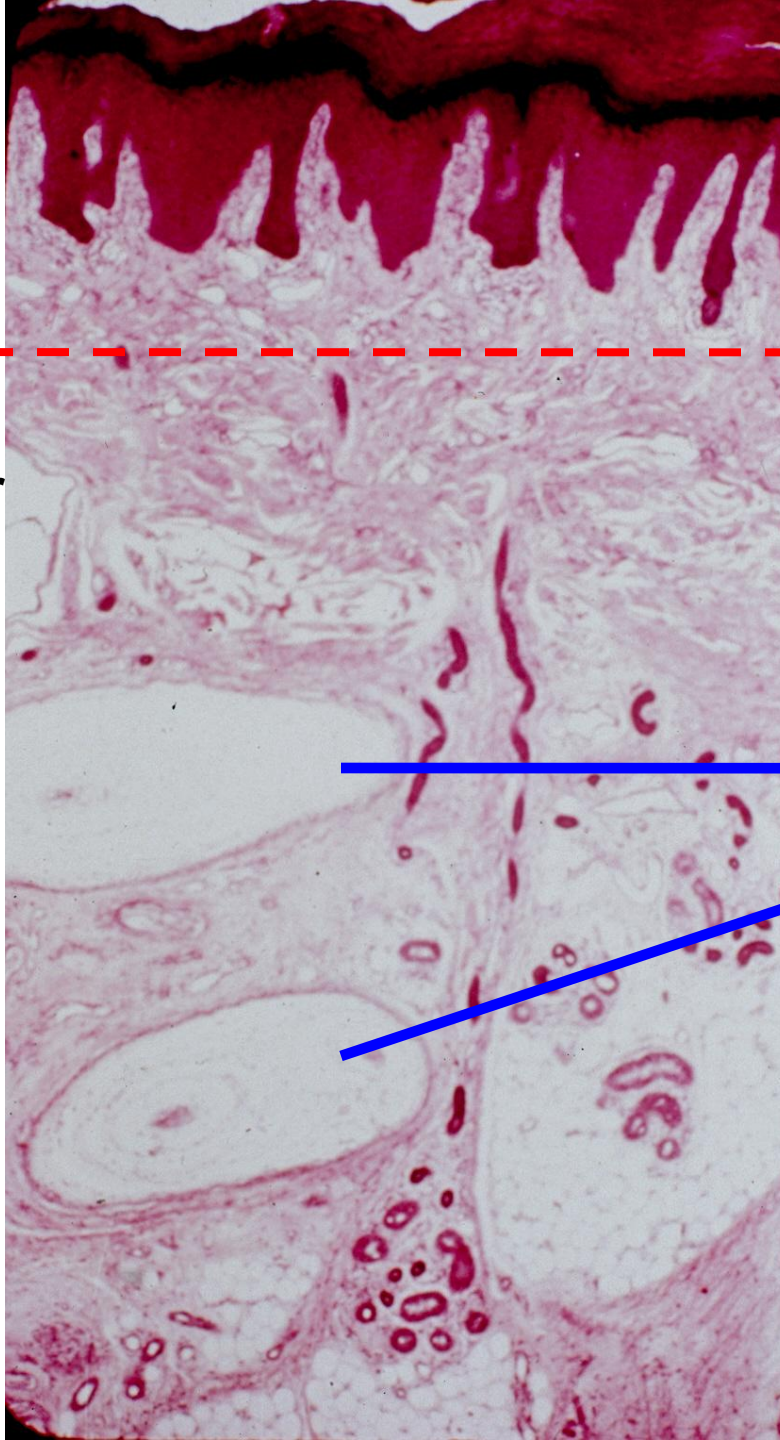

**LOOK FOR THESE
IN DEMO SLIDES !**

Thick Skin-Dermis

Papillary layer

Reticular layer

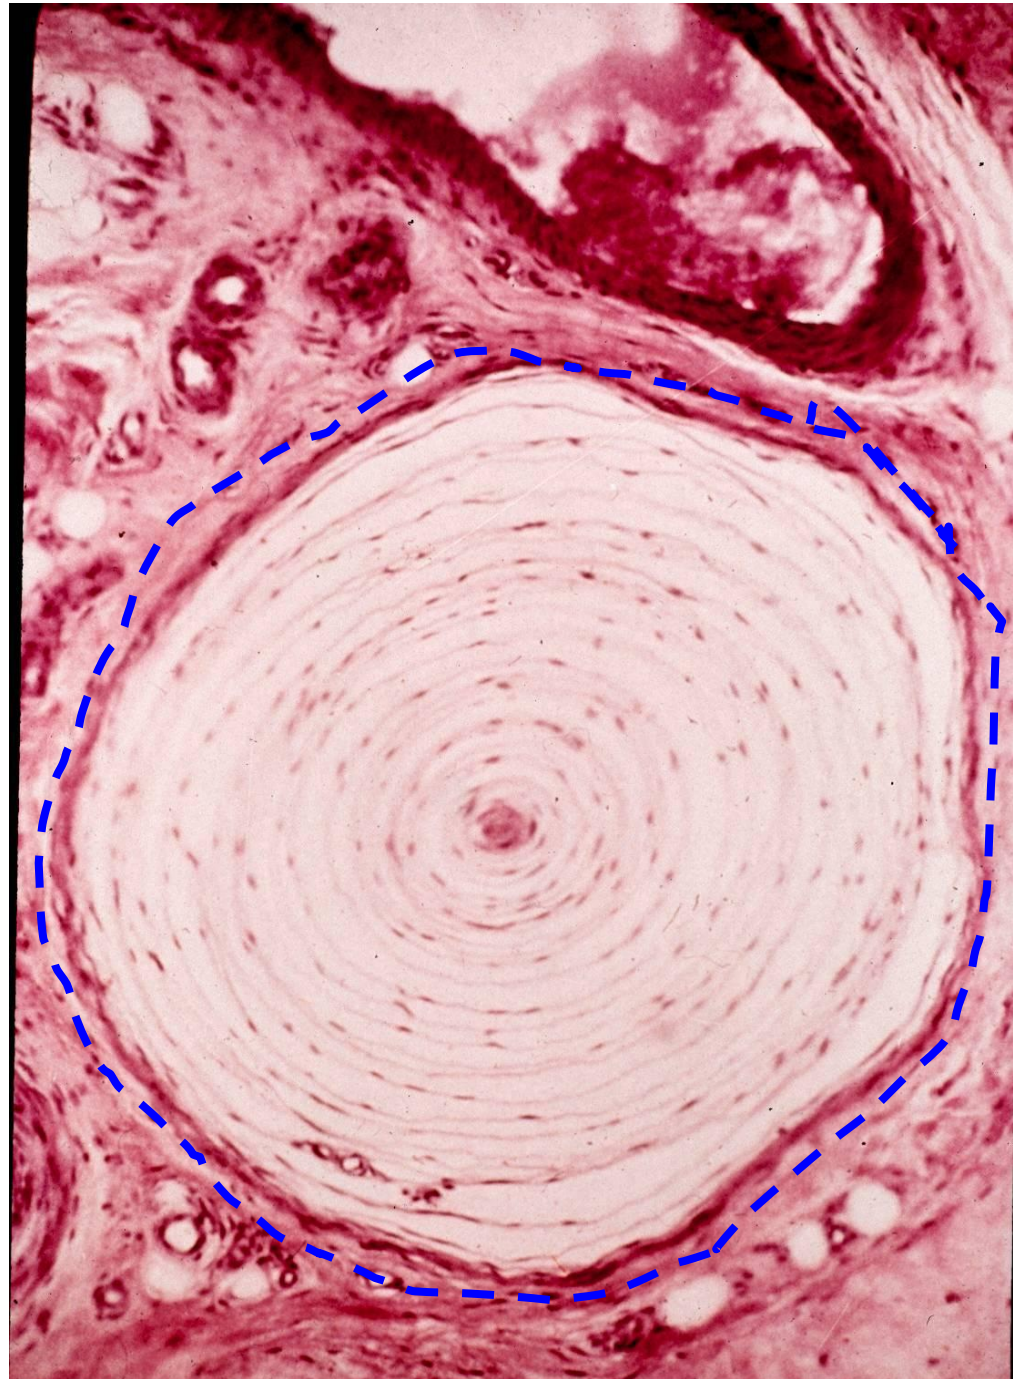

Pacinian corpuscle - look like onions

Pacinian Corpuscle

**Deep pressure
nerve receptors.
Found in deeper
dermis. Look like
onions.**

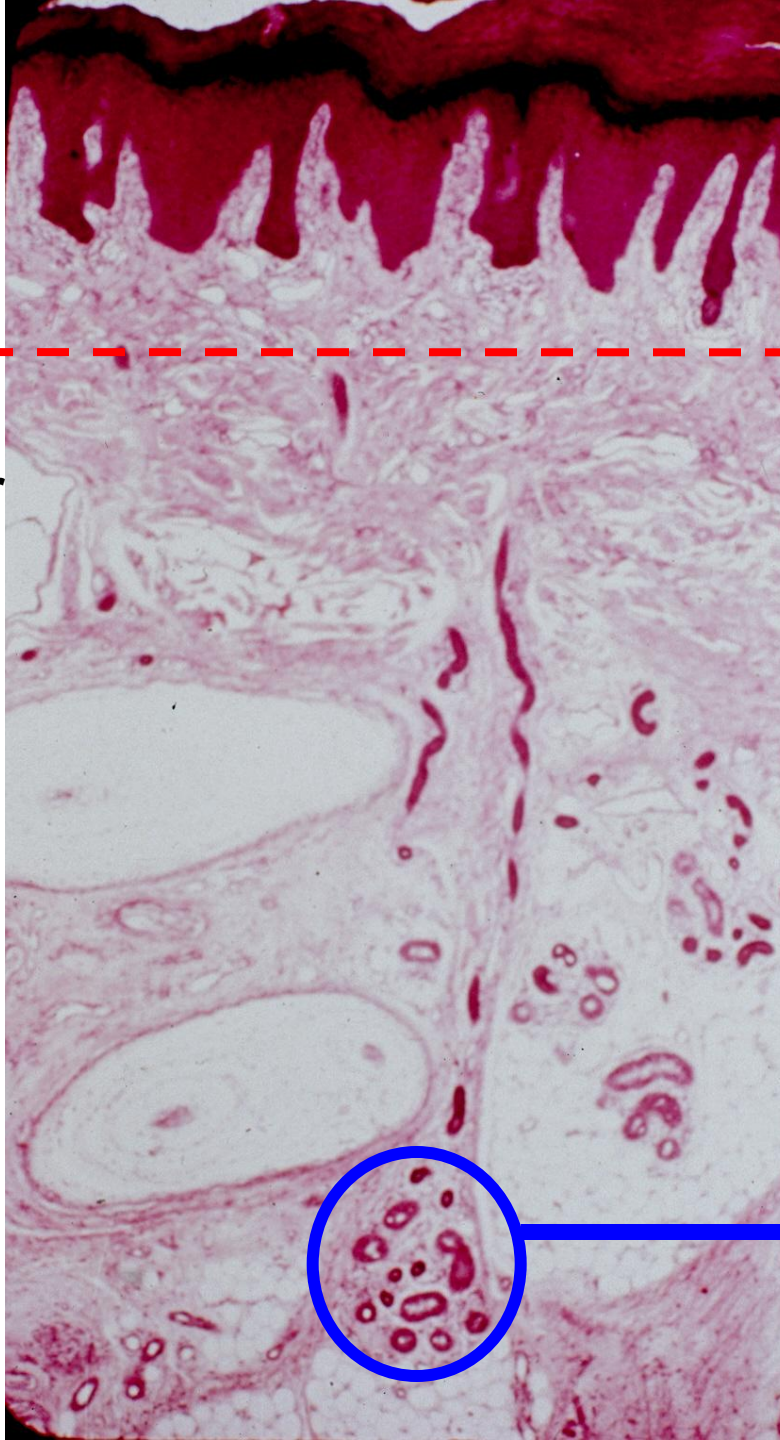

**BEST TO LOOK
IN DEMO
SLIDES!**

Thick Skin-Dermis

Papillary layer

Reticular layer

Sweat Gland/Ducts

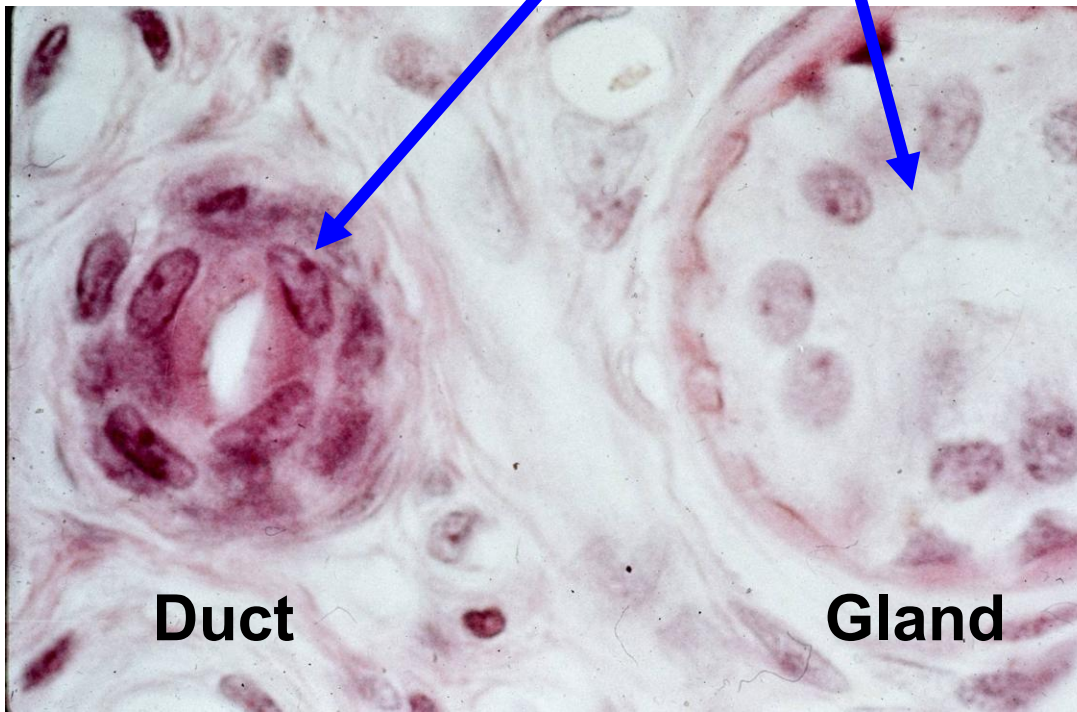

SWEAT GLAND

gland: simple cuboidal, simple columnar epithelium - pie shaped cells tend to be pale

duct: stratified cuboidal epithelium

be able to distinguish

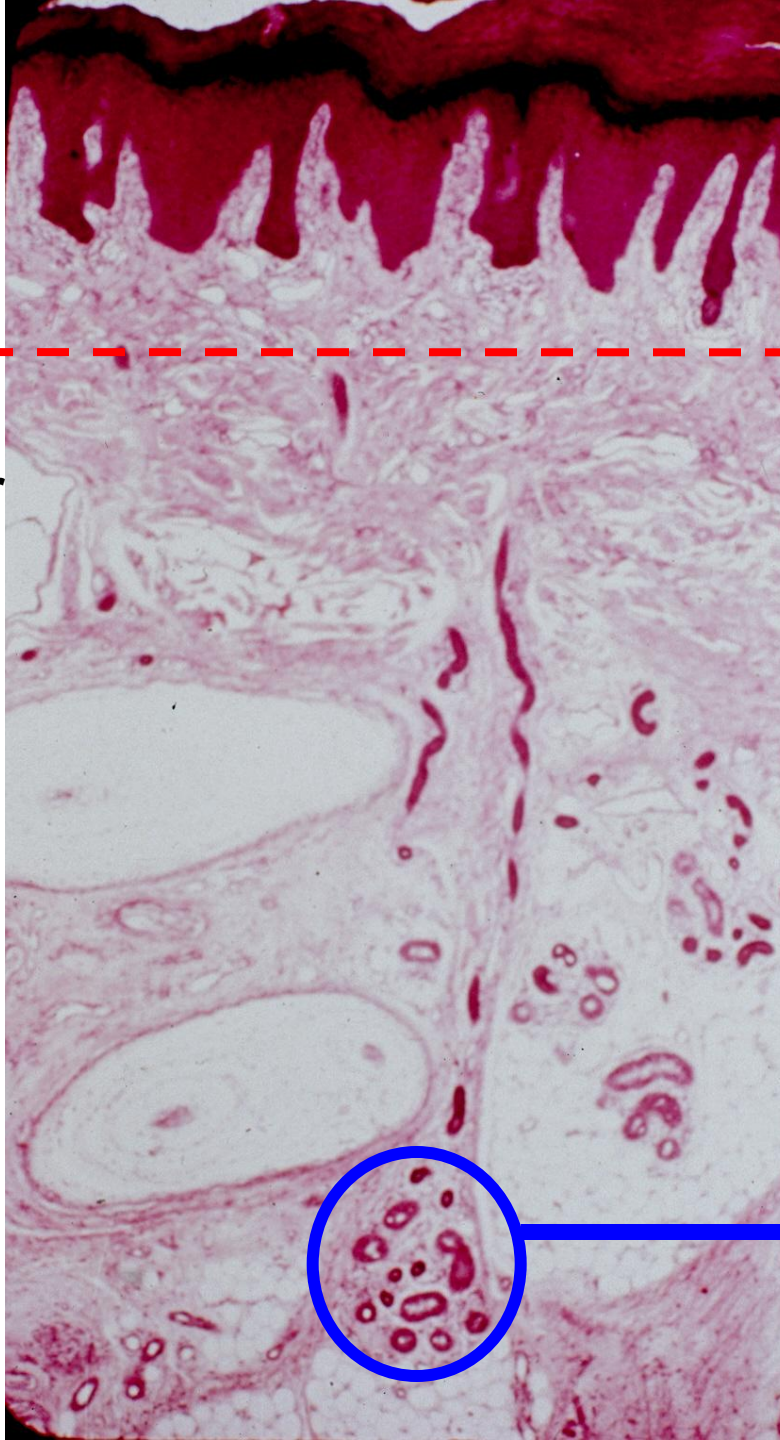

Duct

Gland

Thick Skin-Dermis

Papillary layer

Reticular layer

Sweat Gland/Ducts

thinner keratin only 3 layer

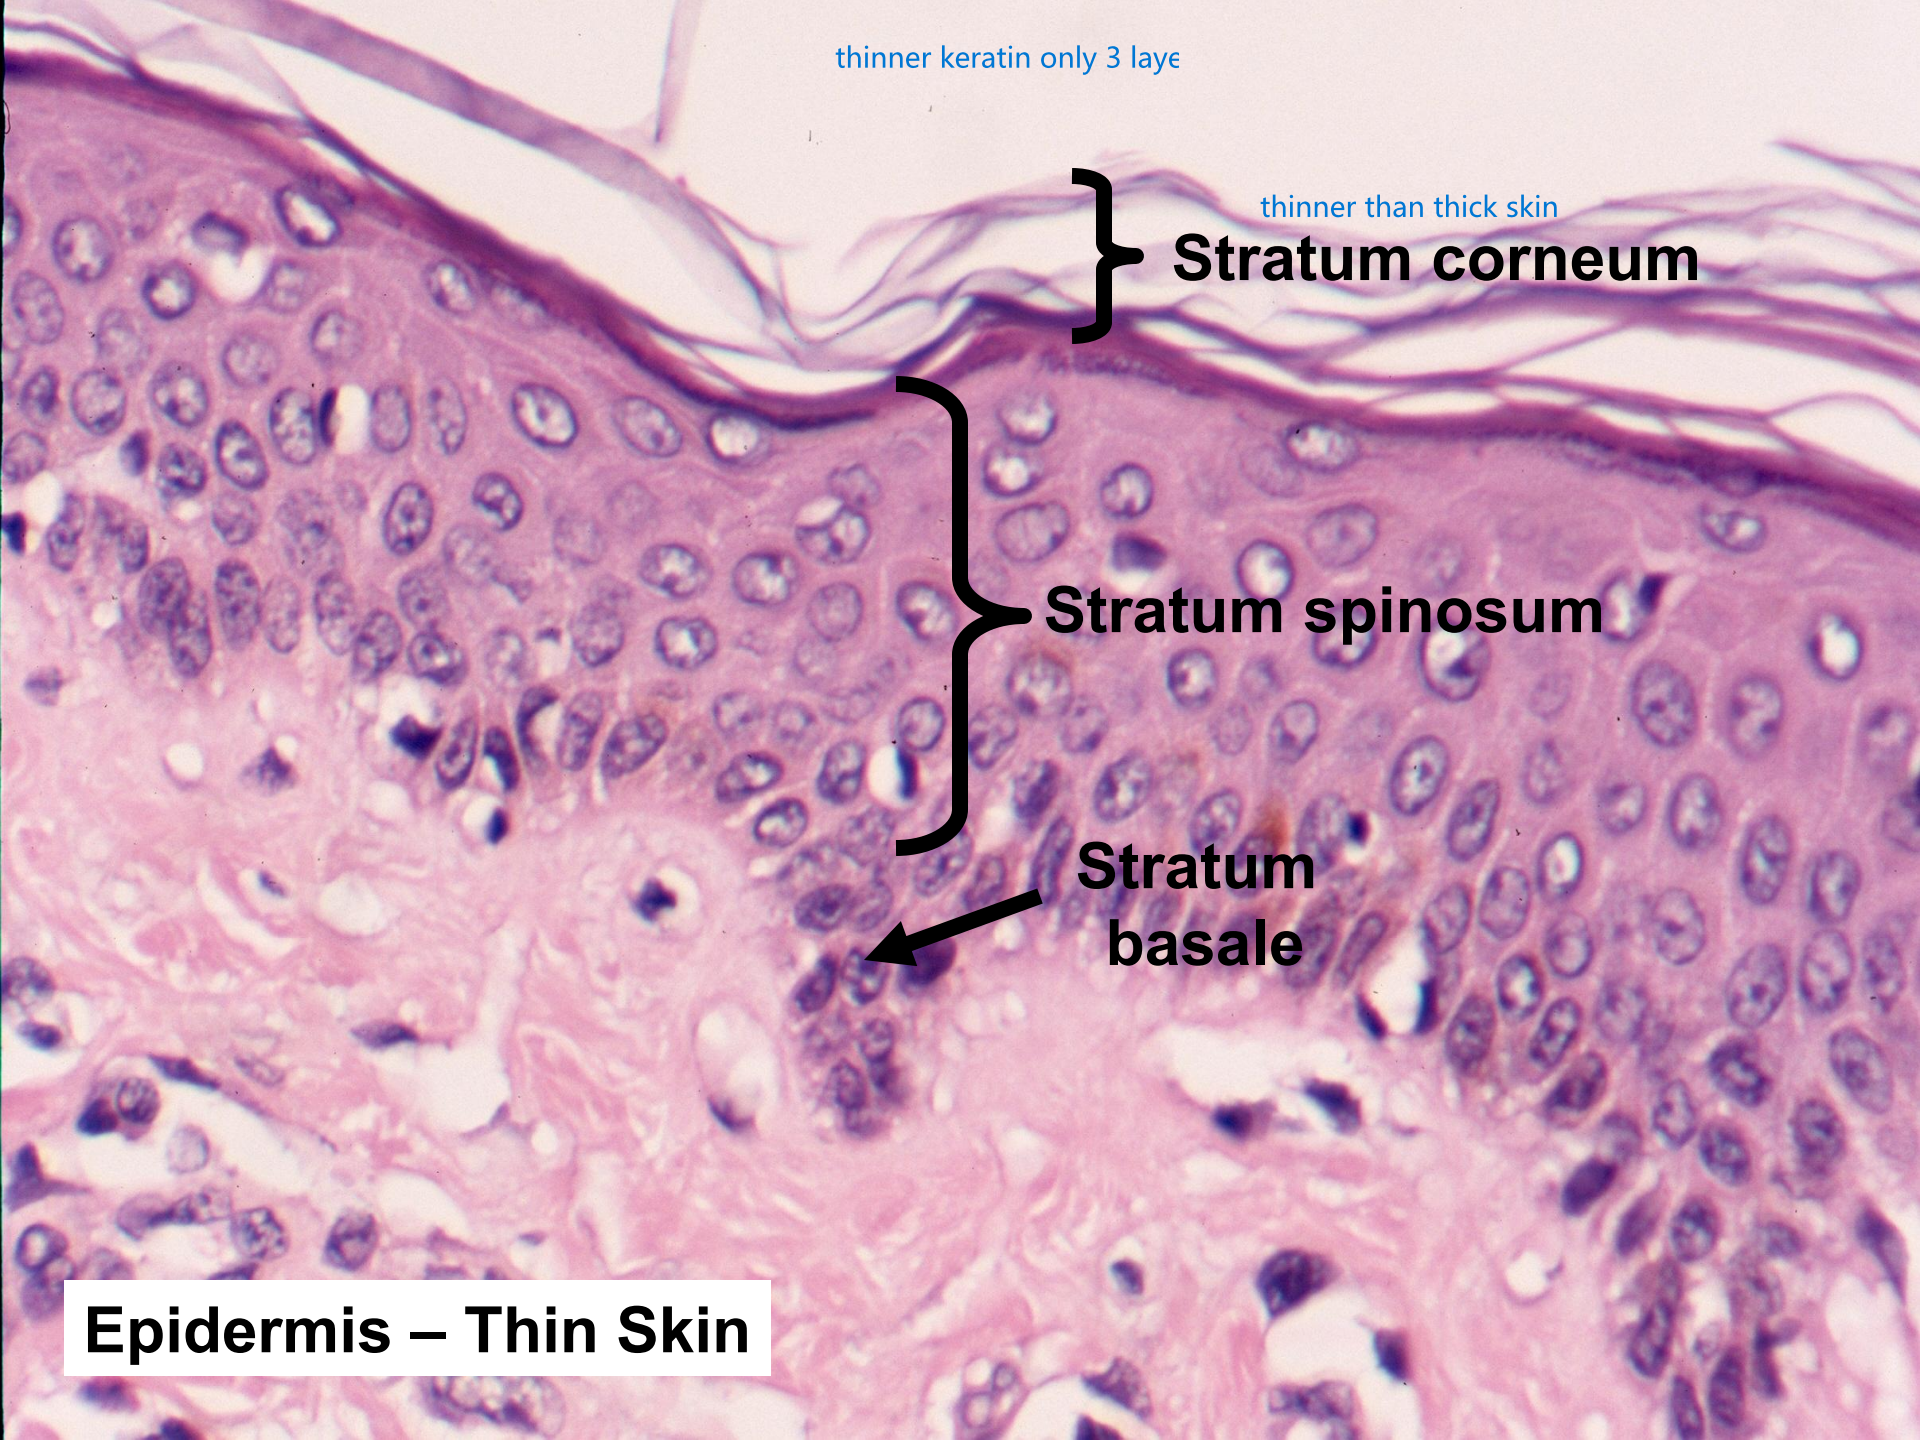

thinner than thick skin

Stratum corneum

Stratum spinosum

**Stratum
basale**

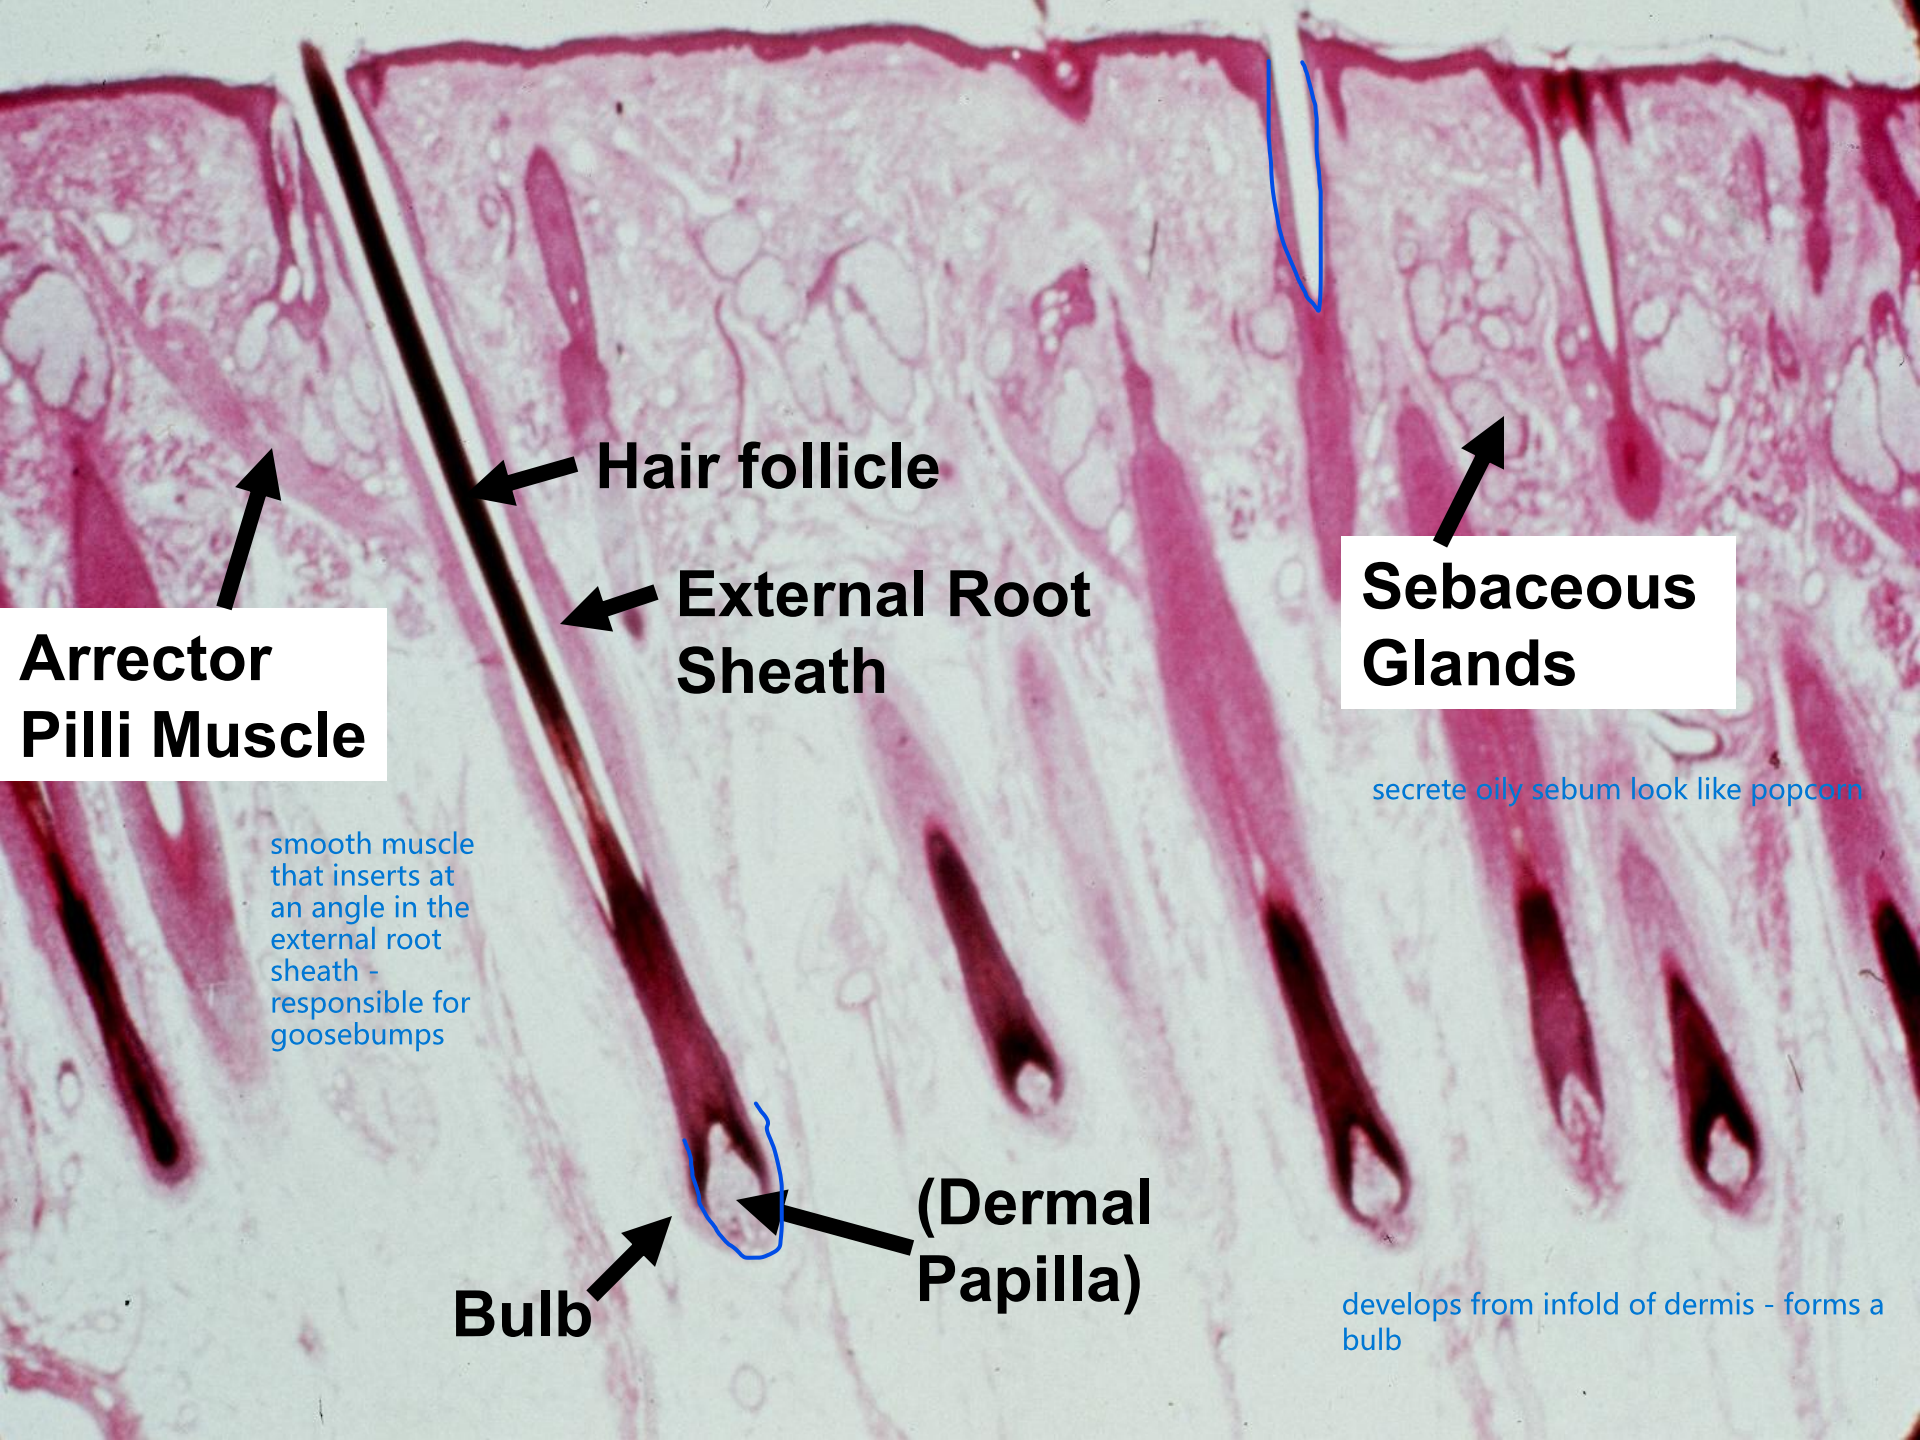

Epidermis – Thin Skin

pigment localized apical - protecting nucleus from UV

Pigmented Thin Skin

**Arrector
Pilli Muscle**

Hair follicle
**External Root
Sheath**

**Sebaceous
Glands**

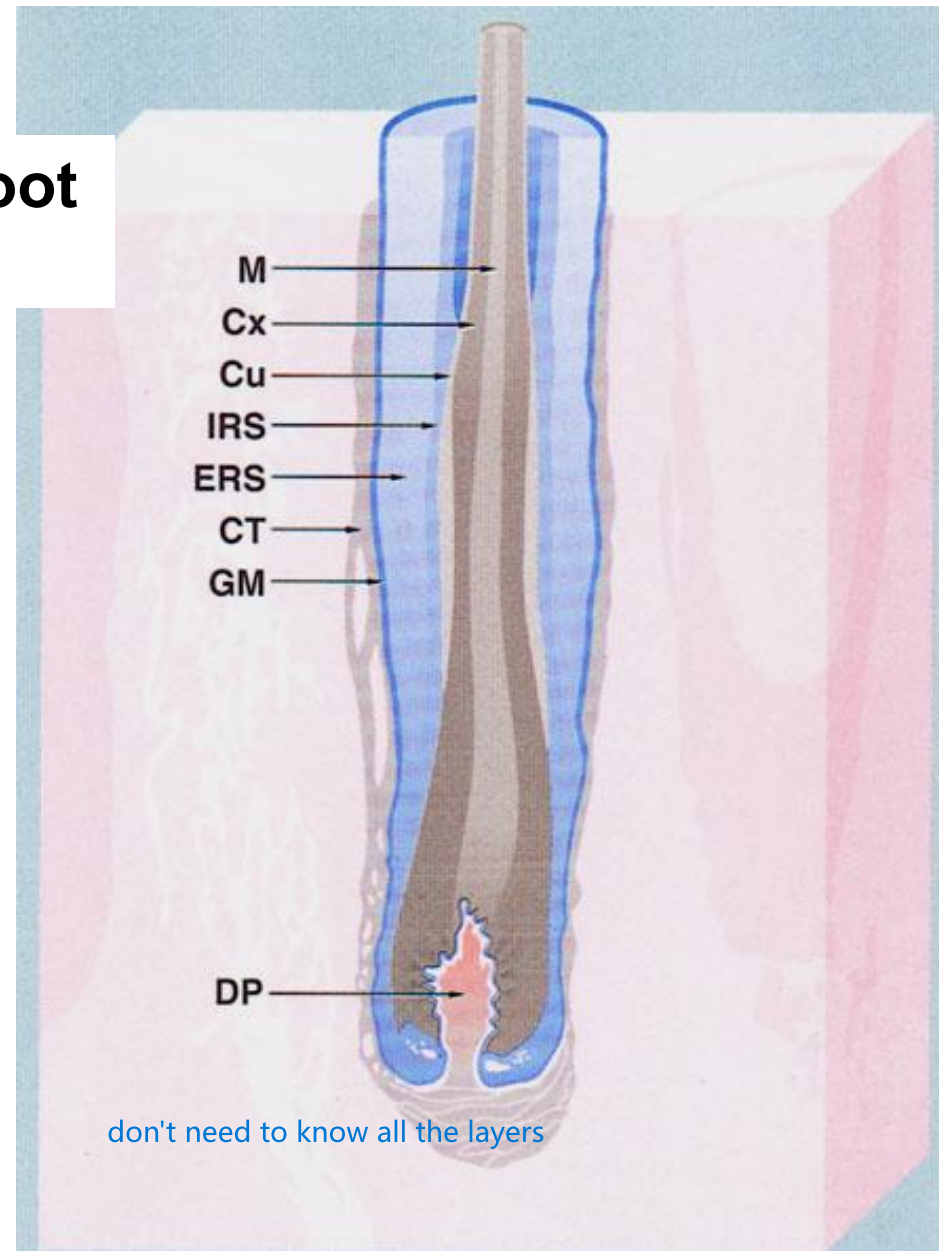

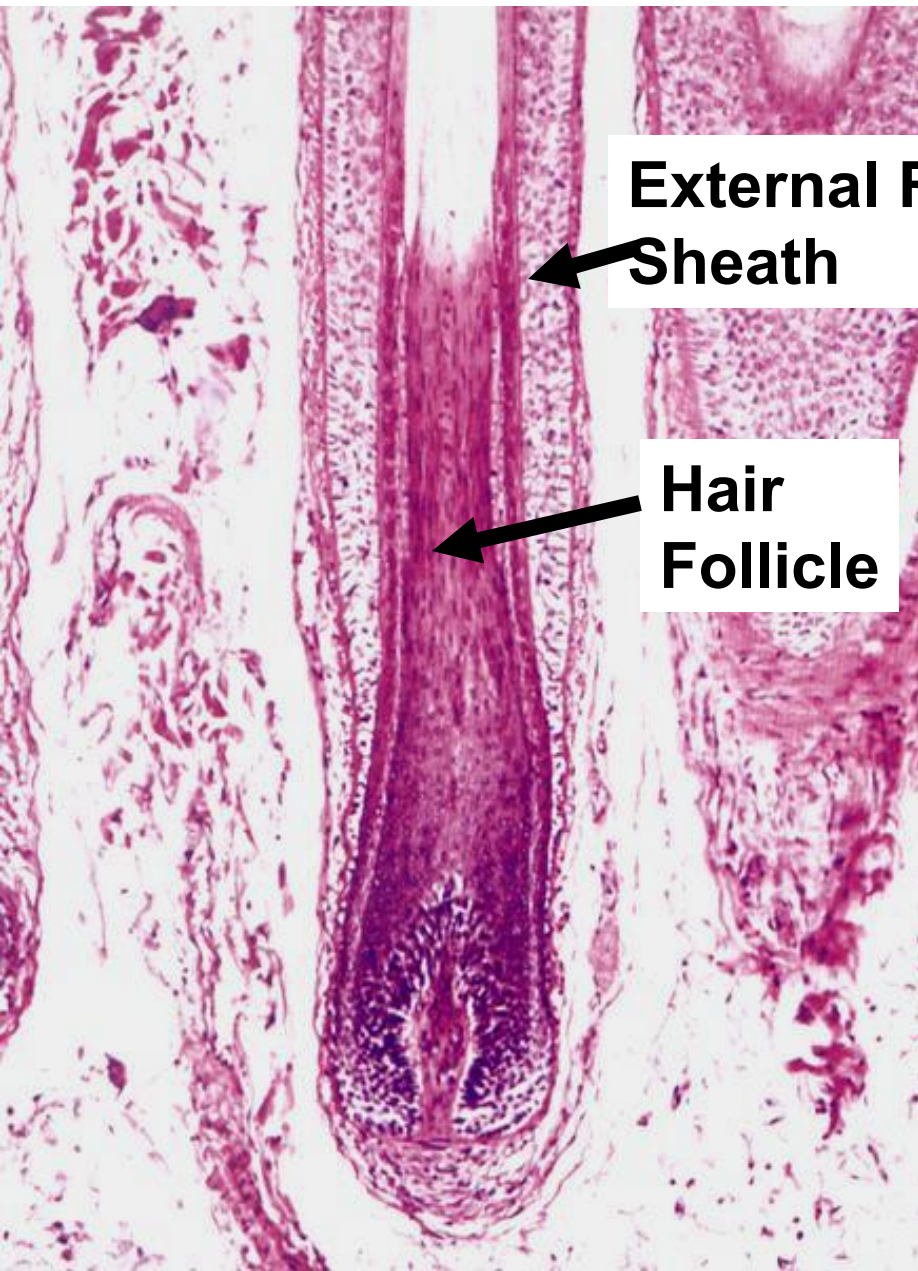

smooth muscle
that inserts at
an angle in the
external root
sheath -
responsible for
goosebumps

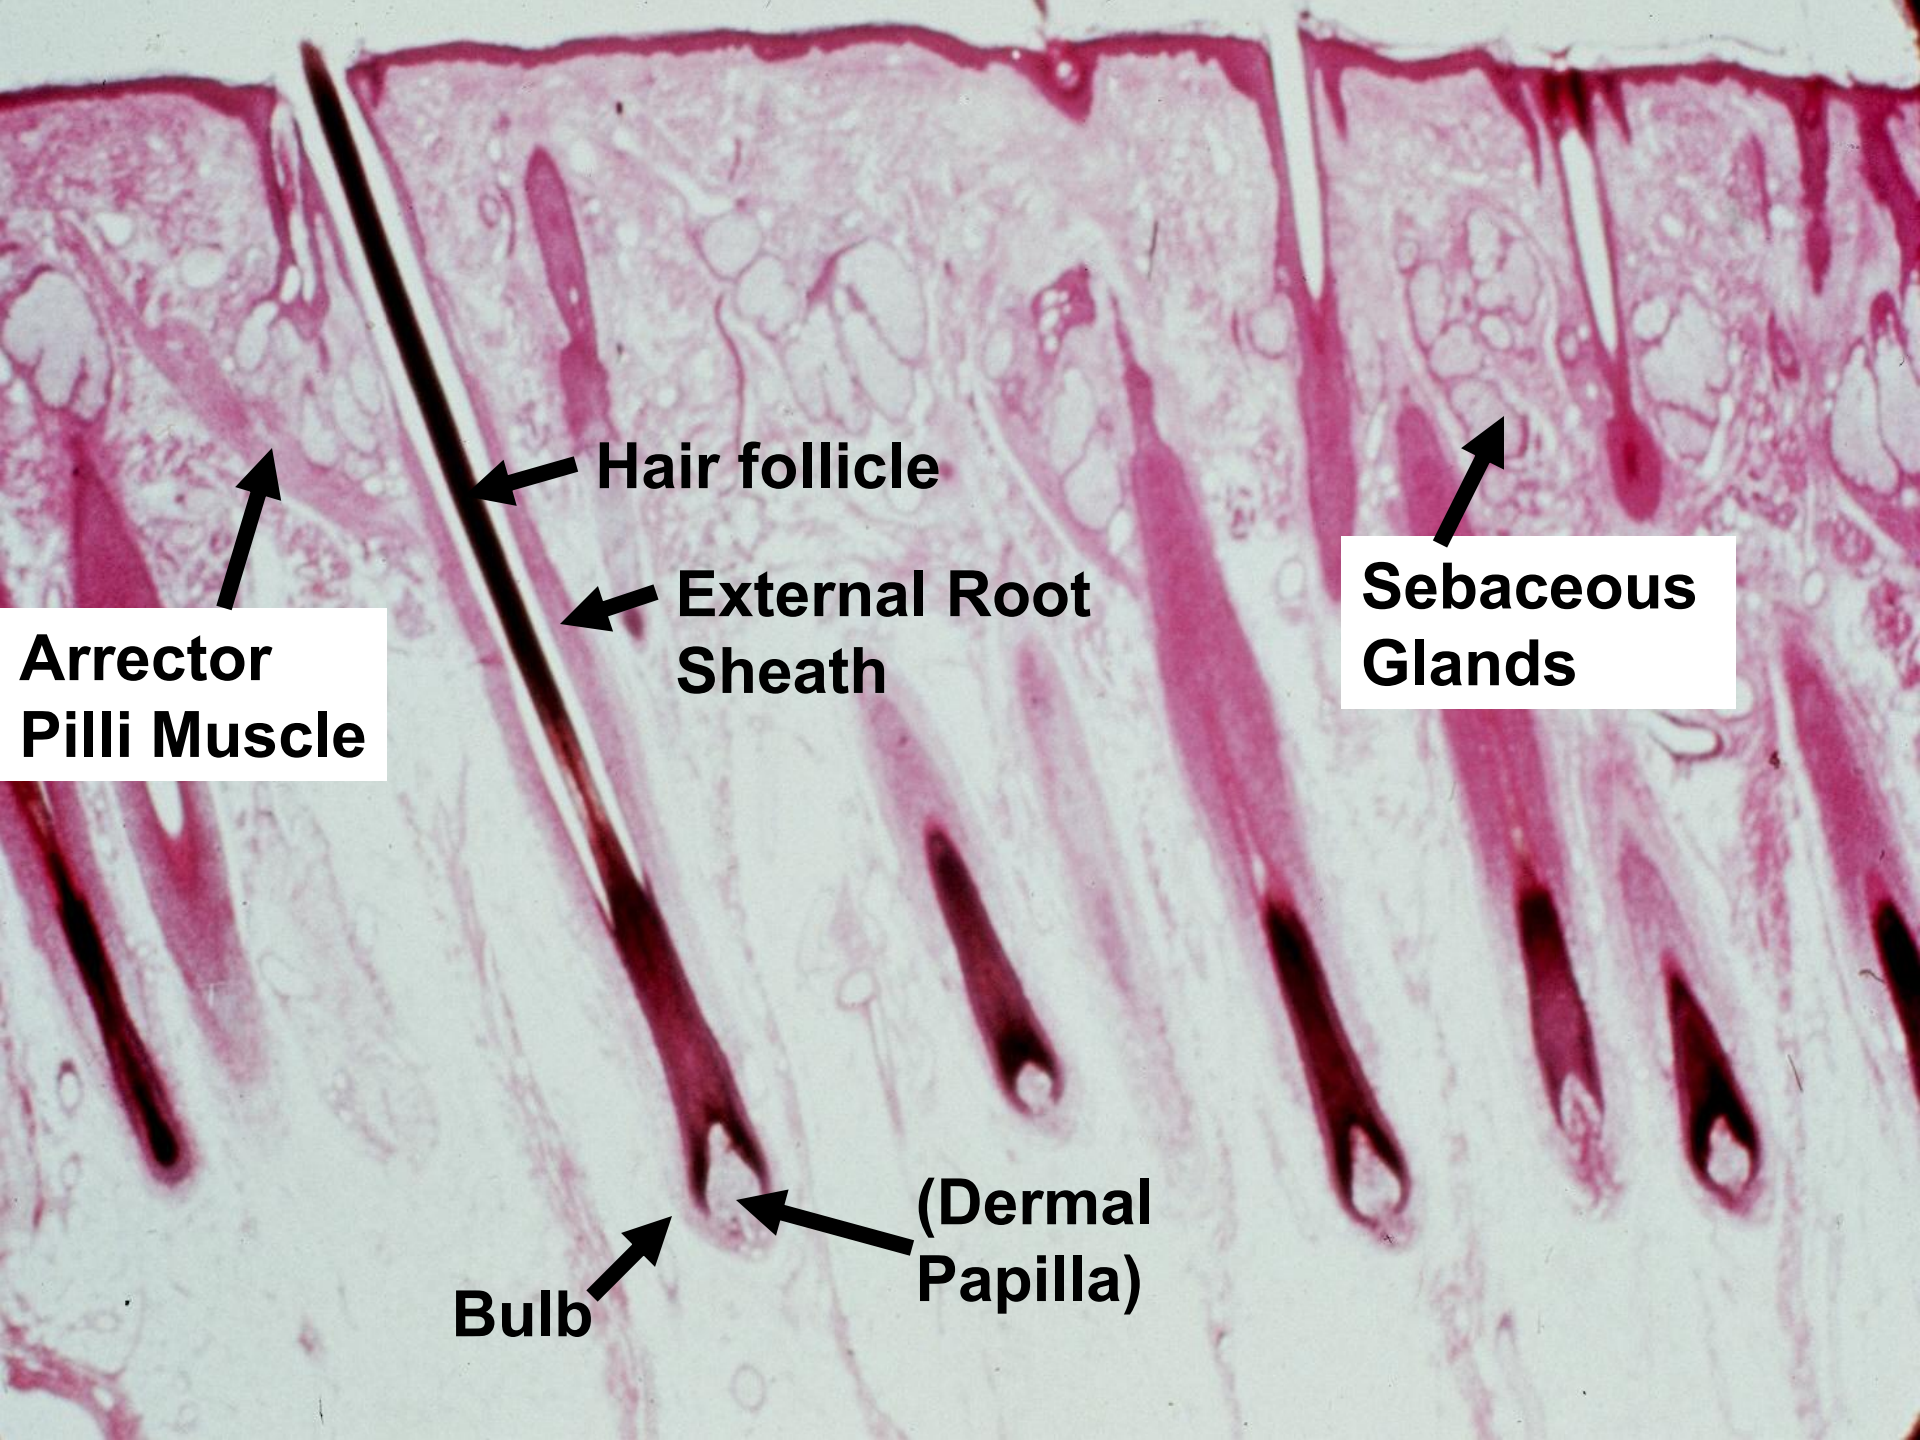

secrete oily sebum look like popcorn

Bulb **(Dermal
Papilla)**

develops from infold of dermis - forms a
bulb

Hair Follicle Structure - Wheater

**Arrector
Pilli Muscle**

Hair follicle

**External Root
Sheath**

Bulb

**(Dermal
Papilla)**

**Sebaceous
Glands**

Hair Follicle c.s. - Wheater
